

MWI Zonal Tracking Solution

Quicktrack is a simple tracking solution for both outdoor & indoor.

It is designed to be hassle-free, and intuitive from installation to accessing the data.

The Solution can be offered as a standalone software license, or as an end-to-end solution.

°QUICKTRACK

Software Features

-  Browser-based Web Client
-  Comprehensive Dashboard
-  Visitor Registration & Lookup
-  Personnel/Visitor Trip History
-  Virtual zoning / Geo-fencing
-  Alerts & Report
-  Mapping
-  Seamlessly supports across multiple geographical locations
-  Export reports to spreadsheet

Benefits

Easy management of personnel/visitors' information

Prevent users from entering into prohibited areas

Alerts with real-time violations to protect the premise

Most affordable tracking solution with least upfront investment

°QUICKTRACK

Zonal Tracking Solution

How it works Visitor Tracking

Registration

Visitors will receive a BLE card tag as a visitor pass in exchange for their Identity Card at the access control point when they first enter the premise.

They will need to carry the BLE card tag with them at all time within the premise as it functions as a visitor pass. They will need to return the visitor pass to retrieve their Identity Card at the end of the visit.

The BLE card tag is constantly emitting a low energy signal to indicate its location.

Tracking

BLE gateways are strategically installed at key areas in the premise, to constantly read the signals from the BLE card tags.

The locations of the visitor will be captured when the tag is within the coverage areas with BLE gateways. The location information will be used for analysis and necessary actions.

These BLE gateways are easy to install and configure for immediate use. The gateway will only need a power source and an existing WiFi network for transmission back into the Server.

Monitor

Visitors' whereabouts will be reflected from a dashboard along with other vital information for awareness.

From the dashboard, we can observe if the visitors are moving into a prohibited area or away from their intended route.

Alert notifications will be pushed to the guards for immediate actions. The historical data are stored and can be used for post-mortem study.

Applications

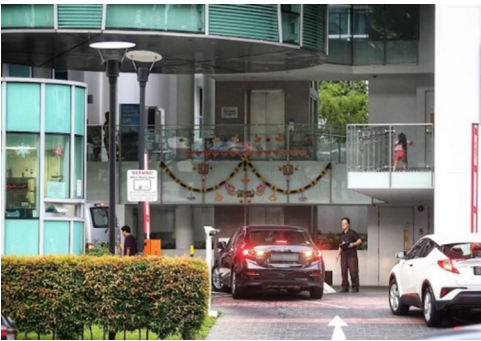

Schools & Campuses

Schools and Campuses are generally large in size and experience high traffic flow due to the amount of students and staffs utilizing the place.

As such, visitors or contractors entering the premise may be hard to keep track, in the large premise with high movement during certain period.

With Quicktrack, security guards can easily keep track of these visitors and contractors from the dashboard and alert notifications.

Condominiums

The safety and privacy are primarily concerns of the Security team. Without proper monitoring system, it is difficult to detect errant visitors.

Most Security Guards when come to visitor management, they can only verify the visitor upon entering but are unable to track where the visitor goes once they enter the compound.

With Quicktrack, the Guards will be able to monitor if any visitors have strayed to restricted areas in real time.

Factory & Plants

For a manufacturing company, the factory floors and plants are sacred locations. Any visitors (vendors, contractors, delivery men and etc,) to these locations should be vetted and approved.

It is also essential to keep track on the movement of these 'visitors' while in location, to ensure the safety of the employees and assets. Any loss of proprietary information or intentional sabotages can mean high financial impact and even negative public relations to the company.

Quicktrack can provide that piece of mind with regards to the safety of the company information and assets.
